

VALUE ADDED WOOD

24th February 2014

Plastic wrapped Treated Pine Posts Vs CUTEK Pre-Coated decking option.

www.cutek.com.au

The Kaituna 90 x 90 posts (from our Kiwi friends across the pond) come plastic wrapped, are close to knot free and are very straight. This is one of the hardest dimensions in timber to keep straight and is a great example of value adding in the timber industry. It's very simple really, customers want straighter wood products. CUTEK Wood Stabilising oils offer an alternative to plastic wrapped wood products and have some significant points

of difference over plastic. CUTEK can be easily and economically applied to any wood species as a PreCoat and can be wet stacked without delay. CUTEK is clear, absorbs right into the wood and is completely non film forming. The oil is permanent and offers high level dimensional stability by keeping moisture out. CUTEK can be used for after market coating and comes in a range of transparent ColourTones that enhance

the natural look of any wood. Plastic wrap offers only limited, short term protection and presents the issue of post consumer waste. CUTEK is a fast and cost effective wood stability option that doesn't have these waste associated issues. It's no wonder why more and more wood millers are adding value with use of CUTEK.
