Trojan house, an award winning residential design in Melbourne Australia by Jackson Clements Burrows Architects.

The wood specified for this interesting design was Spotted Gum, a durable hardwood species. Clear CUTEK was

used to precoat all timber prior to install, and one further coat was applied after install.

CUTEK has been used on thousands of projects in Melbourne and is chosen for its ability to protect the wood long term. The clear oil allows the wood to

naturally lighten and eventually silver over time while still providing wood protection and stability, greatly extending the service life of the timber. If desired, the new colour of the wood can easily be restored with a simple clean and further application of CUTEK.
